

Homework 2: DFAs and NFAs

CSE 30151 Spring 2017

Due 2017/02/02 at 11:55pm

Instructions

- Create a PDF file (or files) containing your solutions.
- Please name your PDF file(s) as follows:
 - If you're making a complete submission, name your PDF file **netid-hw2.pdf**, where **netid** is replaced with your NetID.
 - If you're submitting some problems now and want to submit other problems later, name your PDF file **netid-hw2-123.pdf**, where 123 is replaced with the problems you are submitting at this time.
- Submit your PDF file in Sakai. Don't forget to click the Submit (or Resubmit) button!
- Submissions that don't follow these instructions will lose **1 point**.

Problems (10 points each)

1. **Designing finite automata.** Write a finite automaton for base-10 natural numbers (possibly with leading zeros) that are:
 - (a) divisible by 2. Please write both a formal description **and** a state diagram.
 - (b) divisible by 3. Please write both a formal description **and** a state diagram.
 - (c) divisible by k for any given $k > 0$. Your answer should be a formal description $M = (Q, \Sigma, \delta, s, F)$ where Q , δ , s and F are defined in terms of k . Hint: appending a digit d to a number x is equivalent to doing $x \leftarrow 10x + d$.
2. **Boolean operations.** Define $L_1 \uparrow L_2 = (L_1 \cap L_2)^C$ (that is, the NAND operation on languages).
 - (a) Use a product construction, as in the proof of Theorem 1.25, to prove that regular languages are closed under the \uparrow (NAND) operation.

- (b) Apply your construction to the following two DFAs:

- (c) A *Boolean function* is a function from k Boolean values to a Boolean value. For example,

| x | y | $f(x, y)$ |
|-----|-----|-----------|
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 1 |
| 1 | 1 | 1 |

Recall that any Boolean function can be expressed in terms of \uparrow . For example, the above function can be written as $f(x, y) = (x \uparrow x) \uparrow y$. Using this fact, show that regular languages are closed under any Boolean function. That is, if L_1, \dots, L_k are regular languages, and f is a function from k Boolean values to a Boolean value, then the language $f(L_1, \dots, L_k)$ is regular:

$$w \in f(L_1, \dots, L_k) \text{ if and only if } f(w \in L_1, \dots, w \in L_k).$$

(Here “ $x \in X$ ” is being used as a Boolean value, which is a little nonstandard for mathematical writing, but I hope the meaning is clear.)

3. Nondeterminism

- (a) Convert the following NFA into an equivalent DFA.

- (b) Write an NFA N that recognizes the following language:

$$L = \{uv \mid u, v \in \{\mathbf{a}, \mathbf{b}\}^*, u \text{ contains an even number of } \mathbf{a}\text{'s, and} \\ v \text{ contains an even number of } \mathbf{b}\text{'s}\}$$

- (c) For any $n \geq 0$, show an accepting path for \mathbf{bab}^n through N .
 (d) Convert N to a DFA M , and again show, for any $n \geq 0$, the accepting path for \mathbf{bab}^n through M .
